

Angular Exercise.

Create a simple salary execution application using the data found in `MOCK_DATA.json` (attached) with the following functionality.

Listing of all employees

Via the list the user should be able to:

1. Sort data
2. View them in pages
3. Select all or individual rows

Perform salary transactions

With the selected employees the user should be able to:

1. Execute payments
2. See the payment status for each employee
3. Cancel executed payments

The code should be uploaded in a git repository and a clone link should be sent as a response.

Good luck!
